SCOTT AIR FORCE BASE, CHAPEL 2 HAER No. IL-1196-C INDEX TO PHOTOGRAPHS (Page 4)

HISTORIC AMERICAN ENGINEERING RECORD

SCOTT AIR FORCE BASE CHAPEL 2 (FACILITY NO. 5713)

HAER No. IL-1196-C

Location:	2221 East Drive, Facility No. 5713 O'Fallon vicinity, St. Clair County, Illinois, 62225
	Scott Air Force Base is located approximately twenty-five miles east of St. Louis, Missouri in Shiloh Township, St. Clair County, Illinois. Access to the base is provided via Illinois State Highways 158 or 161 and Interstate 64, two miles to the north of the base. The closest communities are O'Fallon, five miles to the northwest; Lebanon, seven miles to the northeast; and Belleville, seven miles to the southwest.
	The Scott Air Force Base Chapel 2 (Facility No. 5713) is located at latitude: 38.54846, longitude: -89.84396. This point represents the center of the site on which the building is located and was obtained on December 6, 2024 using Google Earth (WGS84). There is no restriction on its release to the public.
Present Owner:	United States Department of Defense
Present Use:	Vacant
	Previous use: 1967- ca. 2015: Non-Denominational/Interfaith Chapel
Significance:	Established in 1917 as a training center utilized by various branches of the United States Army and Air Force, Scott Air Force Base and the related built environment is nationally significant for its association with World War I and II; military communications training; experiments in Lighter-than-Air-Craft technology; and as the Headquarters of the Military Air Transport Service during the Vietnam War.
	Chapel 2 at Scott Air Force Base has a distinguished history within the mid- twentieth-century period of the military base. It represents the Modernist style as applied to ecclesiastical architecture exemplified by the use of exaggerated geometric forms and modern materials, emphasized through the use of innovative glue laminated arches. The arches create a striking, steeply pitched inflexed arch roof that covers an unobstructed, natural light filled, sanctuary on the interior. Additionally, the chapel is an excellent example of a "Chapel-in-the-Round"— a form used prior to 1970 which utilized a circular seating arrangement in the sanctuary to create an intimate and communal feeling. Chapel 2 was the first of the "Chapel-in-the Round" type constructed in the Air Force, and was recognized with a design award from the United States Army Corps of Engineers.

Historian: London Hainsworth & Erica Ruggiero, McGuire Igleski & Associates, Inc., 2025.

Photographer: Leslie Schwartz, Leslie Schwartz Photography, 2025.

Delineator(s): London Hainsworth, McGuire Igleski & Associates, Inc., 2025.

Project Information: This HAER documentation project was undertaken to document Chapel 2 at Scott Air Force Base, St. Clair County, Illinois, prior to the demolition of the subject property as agreed upon between the United States Department of the Air Force, the Illinois State Historic Preservation Office (ILSHPO), and DMS Contracting, Inc. Although the subject property is a building, it is recorded within the existing HAER numbering system for Scott Air Force Base.

> Adhering to HAER guidelines, the subject property was documented through research of historic records, photographs, and maps. Historic material was reviewed as available at relevant archives and repositories. One site visit was conducted to photographically document the site, take note of the existing site conditions, features, and alterations over time, and to field verify historic as-built drawings. Sketch plans were then prepared from the historic as-built drawings and are provided as field notes in this recordation package.

Draft digital photographs of the proposed views for HAER photography were submitted for review by the ILSHPO and the National Park Service (NPS). The ILSHPO and NPS were also consulted regarding the inclusion of historic images/maps and narrative report outline.

The completed HAER documentation will be provided to the Heritage Documentation Programs in the NPS for eventual deposit in the Library of Congress, and the ILSHPO will deposit the recordation package with the Abraham Lincoln Presidential Library in Springfield, Illinois.

Preparation of this documentation was funded and assisted by DMS Contracting, Inc. and was undertaken by Erica Ruggiero and London Hainsworth of McGuire Igleski & Associates, Inc, Evanston, Illinois, under the direction of Erica Ruggiero. Photography was performed by Leslie Schwartz, Leslie Schwartz Photography, Chicago, Illinois.

PART I. HISTORICAL INFORMATION

A. Physical History

- 1. Date(s) of construction: Chapel Construction – 1967 Additions and Alterations: 1984
- 2. Architect/Designer/Engineer:

<u>Chapel Construction - 1967</u> Fields, Goldman & Magee Architects, Mt. Vernon, Illinois

<u>Addition - 1984</u> Kuhlmann Design Group, Inc., Maryland Heights, Missouri

Roof Repair and Replacement - 1994 American Consulting Engineers, Inc., Indianapolis, Indiana

<u>Renovations - 2004</u> Chugach Management Services, Inc., Anchorage, Alaska

3. Original and subsequent owners:

United States Department of Defense (Original and Current)

4. Builder, contractor, suppliers:

Chapel Construction

- Design work and construction were under contracts by the District of Army Corps of Engineers.
- Builder: Robinson Steel Construction Co., Crestwood, Missouri
- Glue Laminated Arch supplier: Unit Structures Inc.

Addition

• Unknown

5. Original plans and construction:

A predominantly complete set of as-built drawings of both the chapel and the addition were provided by the 375th AMW Historian office at Scott Air Force Base. As portions of the chapel and addition as-built drawing sets are incomplete, a list of missing drawings is provided below. A selection of the as-built drawings has been provided as part of this report. Both sets of drawings are available at the 375th AMW Historian office.

Chapel Missing Drawings

The missing sheets include three structural drawings sheets, the Low Level Roof Plan and Details (S-13), the High Level Roof Plan and Sections (S-14), and the Roof Sections and Details (S-15); two mechanical drawing sheets, the Utilities Site Plan and Profile (M-16), and the Plumbing Floor Plan (M-17); and all electrical drawings (E-21 to E-25).

Addition Missing Drawings

Only the sheet that contained the architectural floor plan is missing from the as-built set for the addition. However, a small contract modification drawing of the architectural floorplan is included on sheet number S-3.

6. Alterations and additions:

The exterior and interior of Chapel 2 on the Scott Air Force base has been modified, to varying degrees, through multiple addition and/or alteration projects. The chapel,

constructed in 1967, was designed with the intent that an addition would be constructed in the future. The original set of plans includes a proposed future addition to the north of the building. The addition was ultimately constructed in 1984, following a similar footprint as outlined in the 1967 plans. The addition connects to the original building through a hyphen, constructed by modifying an existing window opening at the center of the north side of the chapel.

In 1994, the roof of the chapel was replaced in kind to match existing, including the shingles, flashing, asphalt on the built-up flat roofs, wood blocking, wood fascia, and wood trim at the parapet. Dutchman repairs were also completed at the exposed ends of the glue laminated arches at the corners of the roof. To attach the new material with the existing arch, eight inch deep holes were drilled into the exposed end after the damaged section was removed and threaded rods set into injected epoxy. Copper flashing to match existing was installed at the top of the new wood section.

In 2004, all wooden entrance and foyer doors, sidelights, and frames were replaced with dark bronze full-light aluminum doors with tempered solar bronze tinted glass. Similarly, the wood frames, trim, and seals at the exterior windows were replaced with dark bronze aluminum fixed windows with a thermal break construction. The glass used in the replacement windows is a solar bronze tinted dual pane insulating glass. Above the window and door openings, all exposed wood was wrapped with dark bronze 24 gauge aluminum. These renovations also included alterations to the interior, including removal of folding wall partitions in the addition and the replacement of the mechanical system.

Other alterations completed at an unknown date within the chapel include the removal of a few doors on the interior, partition screens with doors at the east corridor, a partition wall between the two offices, a partition wall between the two chaplain rooms, and the removal of some of the decorative exterior wood fins that screened the windows at the south side. In the sanctuary the sedilia, pulpit, lectern, altar, railings, choir seating, and the choir screen have also been removed from the chancel.

B. Historical Context

History and Development of Scott Air Force Base

Scott Air Force Base (AFB) was established in 1917 as a training center for pilots and crews of airplanes and airships and utilized by various branches of the United States Army and Air Force. It is one of the oldest air bases in the country and has significantly contributed to various aspects of Air Force history, including: The Aviation Section of the Signal Corps; Army Air Service; Army Air Corps; Army Air Forces; and Air Force.

In June 1917, the War Department leased 640 acres from Shiloh Valley Township for the construction of an aviation field. Originally known as Scott Field (1917-1947), named after Corporal Frank S. Scott, Scott AFB (1948 to present) was a major training center for pilots and ground crews for the American Expeditionary Forces' Air Service. During the first year, dozens of wooden barracks, hangars, administrative buildings, and support structures were constructed.

Flying was discontinued at Scott AFB following World War I, and the base population dropped substantially. Local residents grew concerned that the field would close and sent representatives to Washington, D.C. twice in early 1919. Four months after Armistice Day on November 11, 1918, the War Department purchased Scott AFB in March of 1919, though the future function of the center would be debated for the next two years.

In 1921, Scott AFB was chosen as a Lighter-Than-Air (LTA) station emphasizing dirigible aviation (e.g., the *TA-1* and *TA-2*, balloons or non-rigid airships designed for helium inflation). LTA ships were used at the base to research the capabilities of aerial photography and meteorology, and conduct altitude experiments, Experimentation with dirigibles was the primary purpose of Scott AFB from 1921 to 1937.

The following year, the Air Service Balloon and Airship School opened in 1922, accompanied by a military population of almost 700 men, which required the construction of new facilities. The W.M. Sutherland Building and Contracting Company of St. Louis began the construction of the second-largest airship hangar in the nation, eventually completed in 1923 due to the complexity and scale of the project. During the 1920s, the base saw several other new developments, including the construction of a boiler house and steam heating system, a sewage station, an extension of the base water supply, an electric substation, two fireproof buildings for the production of hydrogen gas, a 500,000-cubic foot hydrogen gas tank, a railroad track to service the airship hangar, a bituminous macadam road, and a new concrete building to house the Air Intermediate Depot in 1923. The base was the site of one of the few helium storage and repurification plants in the country. Two storage tanks were constructed in 1925-26 and 1928-29. In 1927, W.C. Johnson, a local contractor, completed a 176-foot-high mooring mast. The mooring mast was designed to anchor dirigibles during inflating and repair procedures.

Because of Scott AFB's central location, it was then selected to be the new home of the General Headquarters Air Force (GHQAF), which managed the air combat arm of the U.S. Army, in 1936.

To meet the needs of the GHQAF, a massive new building program was initiated. In 1938, Scott AFB was expanded from 628 acres to 1,574 acres. A year later, it was again increased to 1,882 acres, nearly three times its original size. Most of the World War I and Lighter-Than-Air frame structures were demolished. Only a few buildings were saved, including the electric LTA substation, the 9th Airship Squadron headquarters/barracks building, nine sets of brick noncommissioned officer's quarters at the south end of the base, and a brick theater. A WPA workforce of 2,500 men and a funding appropriation of \$7.5 million led to the construction of several new buildings in 1939.

Due to the outbreak of World War II, the move of the GHQAF to Scott AFB was never completed; instead, Scott AFB was selected to be the Basic School of the Air Corps Technical School (ACTS), which provided training for aircraft mechanics, welders, armorers, and radio operator-mechanics. With the arrival of ACTS, the multi-million-dollar expansion of the base continued into 1940 with the construction of twenty-one more buildings, including a 200-man barracks, Hangar No. 1, a central heating plant, a new entrance gate, a forty-three-bed hospital, and a GHQAF office.

Despite a tremendous increase in construction during 1939 and 1940, the built environment of the base remained insufficient to house the training school personnel, and cantonments were seen as the most efficient way to expand. Cantonments served as separate communities, with their own amenities such as chapels, recreational facilities, and post exchanges. Over four hundred temporary frame structures were built in just two years between three cantonments. The last building phase was completed in 1942 and consisted of a fourth cantonment, which was composed of approximately seventy buildings that housed shipping and receiving activities for the base.

The cantonment community that included the Wherry Daly-Lewis Housing Area contained a chapel building - a typical cantonment-type chapel - known as Chapel 2. That chapel burned in a fire in 1964. It was replaced in 1967 with Chapel 2 (Facility No. 5713), the subject of this HAER report.

During World War II, Scott AFB was the training ground for hundreds of airmen, primarily radio operators and mechanics. By June 1945, the base had trained 77,370 technicians responsible for vital command and control communications throughout the Air Force. The base acted as the Air Force's parent radio communications school as other radio schools were started in Mississippi, Wisconsin, South Dakota, and Illinois, which followed the model established at Scott AFB.

In 1949, a major command headquarters was housed at Scott AFB with the relocation of the HQ Air Training Command (ATC). Scott continued as a major training base for the Air Force until 1957.

In 1957, Scott AFB became the home of the Headquarters Military Air Transport Service. As the mission of the base shifted to aeromedical airlift, it phased out communications and technical training programs. The reach of the base units included aeromedical lift missions ranging from Alaska to the Caribbean offshore bases. In 1968, the base welcomed the C-9A jet aircraft (or the Nightingale). The C-9A was designed to travel farther, carry more passengers, and provide a more comfortable experience during aeromedical transport missions. The introduction of this aircraft during this period was critical, due to the outbreak of the Vietnam War. Between 1967 and 1970, the United States military evacuated an average of 60,000 patients. Scott AFB played a major role in these evacuations through the on-base Patient Airlift Center. The Center coordinated the return of 357 Vietnam War Prisoners of War back to the United States.

Continuing this legacy today, Scott AFB is the only military base serving as host to three major commands. These commands are the Air Mobility Command, the Air Force Communications Command, and the U.S. Transportation Command.

History of the Architectural Style and Form of Chapel 2

The architectural style of Chapel 2 follows trends set by the Modern Gothic subset of the Modernist movement. While Modernist trends were utilized in Europe as early as 1930, the Modern Gothic did not take hold in the United States until the early years of the 1950s. By 1954, ecclesiastical periodicals published favorable opinions about modern styles for religious buildings. The Modern Gothic adapted the character-defining features of the Gothic

cathedral through similar design techniques. The primary aim was to create a large, unobstructed interior sanctuary filled with natural light that drew the eye upward. While the medieval Gothic utilized arches, tall stone walls, buttressing, and domes to create interior height, Modern Gothic utilized relatively short walls capped with steeply pitched, curving, multi-geometric, and parabolic roof shapes to open the interior space. To create these complex roof forms, technologically innovative, novel materials, and construction methods were put into place. Furthermore, a shortage of traditional building materials during World War I and II, encouraged innovation in building design. This created the climate in which Modern Gothic was introduced, with experimental ecclesiastical architecture that branched away from historical religious building forms and design characteristics.

Early examples of Modern Gothic design were inspired by the overall interior layouts, use of natural light, and user experience of the medieval Gothic style. However, the overall effect of the Gothic style was modernized by removing its highly decorative nature and replacing it with linear, geometric design, symmetrical forms, and minimal ornament. The new style emphasized raw building materials like concrete, composite materials, laminated wood, and aluminum or steel window casings.

Church designs by Eliel and Eero Saarinen-architects of North Christian Church in Columbus, Indiana and Christ Church Lutheran in Minneapolis, Minnesota—set the precedent within the movement. Both Saarinen examples were designed with natural light and spacious interiors in keeping with the Gothic style, but the designs also used scientific acoustic design and minimal construction cost at the forefront of the modern design. At Christ Church (1949), a large interior sanctuary is created with monumental masonry walls supporting a flat concrete roof. Natural light fills the space from a series of windows separated by concrete dividers at the base of the side walls. The interior is unadorned, with unpainted masonry and concrete elements. Similar to the common Latin Cross footprint of historic Christian architecture, the soaring sanctuary space is bisected by a central aisle (or nave) flaked by seating set within shorter spaces (side aisle). The central aisle leads to a pulpit at the short end of the building, which is slightly rounded (similar to an apse). There are no domes or vaults, but rather a simple, unadorned flat ceiling. The upper third of the walls contain no openings but do feature patterned, relief brickwork to capture sound waves. Later Modern Gothic designs, such as the North Christian Church (1964), featured similar modern materiality, but opened up interior volumes with complex roof forms rather than with monumental walls. The roof is a steeply pitched, pentagonal hipped roof with a central skylight and a soaring pointed steeple. The interior sanctuary floor plan mimics changes to the Modern Gothic as well. These changes reflect decisions by ecclesiastical leaders during the mid-twentieth century to appeal to a modern, post-war audience. Historic architectural traditions were challenged, including the prominent Latin Cross floorplan. Instead, churches experimented with circular, square, and diamond seating arrangements around central pulpits or chancels. The aim of these layouts was to create a feeling of community within the sanctuary by visually connecting worshippers with each other during services.

The design of Chapel 2 at Scott AFB expresses the principles of the Modern Gothic movement through its multi-geometric roof design and interior layout. The overall form of the church is identified as a "Chapel-in-the-Round." The form is not based on historic religious architectural traditions, but rather the architecture of the "Theater-in-the-Round." This tradition surrounds the audience around a central stage in a "round" pattern. When applied to religious architecture, the "round" form fosters a sense of community and openness

by creating a visual connection between congregants. Between circa 1950 and circa 1975, the "Chapel-in-the-Round" form was utilized by interfaith congregations for this purpose. This form was applicable to the Air Force, who provided religious services to an interfaith community within a singular structure. The Chapel 2 building at Scott AFB was the first "Chapel-in-the-Round" constructed by the Air Force. The architecture team of Chapel 2, Fields, Goldman & Magee won a national design competition held by the Airr Force to design a similar "Chapel-in-the-Round" for the Wright-Patterson Air Force Base near Dayton, Ohio. This chapel, the Prairies Chapel, is extant and considered the second of its type constructed by the Air Force.

The significance of the design for Chapel 2 is best summarized in the remarks provided by Chaplain Daniel B. Jorgensen at the dedication ceremony on March 31, 1967:

Chapel 2 of Scott AFB is the first chapel in-the-round to be built in USAF. The architectural effect is the emphasis on the congregation as a worshiping people, who surround an altar which is the focal point of interest. Whether the group be small or large, the fellowship of aspiration and inspiration involves each person in the act of worship. Thus, dominant trends of the new Roman Catholic liturgy, Protestant teaching on the role of the layman, and the Jewish traditional practice of the leadership of the Father in the family are here realized. The only natural light in the sanctuary comes from the skylight over the altar, symbolizing the light of God. There are three main pieces of furniture in the altar area. The altar itself is the place traditionally associated with sacrifice and the upreach of man to God, the Author of life. The candles on it symbolize not only the light of God but that each believer is himself a bearer of light. The Scriptures remind us that God is revealed through His word. The lectern is used for leading worship. The pulpit is used for interpreting the Scriptures in sermon. The altar rail provides a place where worshippers may kneel in private devotion or for receiving Holy Communion. The exterior of the chapel sweeps upward from the earth to the sky above, reminding the passer-by that this is a place of prayer.¹

Architects of Chapel 2

The architects of the chapel were Fields, Goldman & Magee (FGM), headquartered in Mount Vernon, Illinois. The firm was established on January 1, 1963 with founding partners Clifford R. Fields, Jack Goldman, and George Magee. Before organizing their firm, the three men participated in the organization of the Architect's Association of Mount Vernon (AAMV) in 1962. The club membership was comprised of forty Mount Vernon based architects who promoted the city as a center of cultural innovation in the architectural field. The AAMV promoted modern architectural principles to city government as well as provided interior decorating clinics to civilians

Clifford Ray (Zeke) Fields (b. 1926, d. 2010) was born and raised in Mt. Vernon. During World War II, he served as a Private in the United States Army Air Forces. After the war, he studied at both Oklahoma A&M and the University of Illinois School of Architecture,

¹ Martin H. Scharlemann, Chaplain, Brigadier General, USAF, Reserve (Ret.). *Air Force Chaplains, 1961-1970.* (St. Louis, Missouri: United States Office Chief of Air Force Chaplains), 76.

graduating with honors. In 1950, he was awarded first prize in a nationwide architectural design contest for college seniors, the Angus Snead MacDonald prize. His winning design was for a ten-story office building with a library. During his senior year of college, he was hired by McCoy and Wilson, architects, in Mt. Vernon. By 1954, he had joined architect Jacob Gatewood to form the architecture firm of Gatewood and Fields. By 1961, his partner Jacob Gatewood passed away and the firm was reorganized as Clifford R. Fields & Associates. Two years later, in 1963, FGM was formed. During the early years of his career, Fields became very community minded, joining charitable and fraternal organizations and advocating for educational architecture reform and investment. Fields' early work in the firm reflected his dedication to education, designing several schools in Illinois, including Georgetown Grade School (Aurora, 1962), Mount Carmel High School (1964), Zeigler-Royalton High School (1965), and North Elementary School (Hopkins Park, 1966). Furthermore, he served on the Summersville Grade School Board of Education in Mount Vernon. His later works include hotels, airport buildings, banks, and government buildings.

Jack Mitchell Goldman (b. 1925, d. 2015) was born and raised in Decatur, Illinois. He joined the United States Army in 1943 where he served in the Pacific Theatre as a Staff Sergeant during World War II. He fought in the battles of Leyte and Okinawa and received four Bronze Stars. He utilized the G.I. Bill to study architecture at the University of Illinois. While a student, he was awarded the 1957 Francis J. Plym Fellowship. It provided him with three years of study, including six months of European travel and two and one half years of apprenticeship at the prestigious architecture firm, Eero Saarinen & Associates in Bloomfield Hills, Michigan. While working with Saarinen, he assisted with the design of the American Embassy in London and the St. Louis Gateway Arch. After his fellowship, he joined Gatewood and Fields as the chief of design. The next year, in 1961, he became a partner at the firm upon the death of Jacob Gatewood. Goldman continued to work for FGM until his retirement at the age of 80. His obituary states that a significant accomplishment of his was the design and development of the Mitchell Museum and the associated Cedarhurst Sculpture Park in Mount Vernon in 1969. He was also the principal designer of Chapel 2 at Scott Air Force Base (1967), the Immanuel Lutheran Church (Altamont, 1969), and the First National Bank (Wayne City, 1967). He served as the secretary of the American Institute of Architects Southern Illinois Chapter and was a member of the National Committee on Design.

George Eldridge Magee (b. 1933) was born in Clinton, Mississippi and raised in Washington County, Louisiana soon after. He attended the University of Illinois School of Architecture. While there, he was awarded the Ricker prize for academic excellence in architectural history and the Francis J. Plym fellowship. In 1956, he graduated and was hired by Wilson & Coleman, architects of Baton Rouge, Louisiana. By 1960, he was hired by Gatewood and Fields and moved to Mt. Vernon. Notable designs headed by Magee include the Doctors Hospital (Harrisburg 1965); Robina Lyle Elementary School (Bridgeview, 1967); Meridian High School (Mounds, 1968); and Columbia High School (1969). At FGM, he headed the organization of the engineering department in 1971. Also in the 1970s, Magee served as the President of the Board of Education for School District No. 3 in the Jefferson County, Illinois. In 1982, he led a small-scale redevelopment of the downtown area of the city of Herrin.

Overall, the mid-twentieth century legacy of the firm includes a number of unique Modernist structures, including a novel football-shaped office building for the Mt. Vernon Loan and Building Association (Mt. Vernon, Illinois, 1965) and a "circular gas station" design for the

Liberty Petroleum Co. (Mt. Vernon, Illinois, 1969). In 1965, the firm won four architectural design awards from the Southern Illinois chapter of the American Institute of Architects: the remodel of the First National Bank of Nashville, Illinois; the Mayfair Lennox hotel-motel in St. Louis (which also won an award from Institutions Magazine); and two Mt. Vernon, Illinois residences (for Mr. and Mrs. Sam Shaw of Pace Avenue and Mr. and Mrs. James Carter of Ashley Road). The three founding partners operated within Fgm until their respective retirements. The firm is extant; known today as FGM Architects.

History and Development of Glue Laminated Arches in the Post War Era

During the post-war period, the influence of the Modern Gothic style, along with evolving building technologies, allowed for the widespread use of non-traditional building materials. Timber catalogs from the period cite the overuse of wood during the wars as the reason for renewed interest in building material science that created the forest product industry. Rather than using timbers in their traditional sense, modern lumber was more often created using wood chips, sawdust, and glue to create laminated lumber; the most common of these materials is plywood.

Glue Laminated Structural Timber was one of the first modern materials widely used in America during this period. Often called "glulam," this material is made through a process called "factory growing." Here, woodworkers kiln dry and surface wood boards (often of Southern Pine), then apply water-resistant casein glue to multiple layers of boards and laminate one board atop another to create the necessary structural capacity. The boards are then clamped together and finished. In some instances, the boards are then bent into arches and bows to create large, complex forms.

Although glulam had been used in other parts of the world since the beginning of the twentieth century, the material did not have a supplier in the United States until 1934. That year, Max Hanisch Sr., an architect and engineer, designed the public school and gymnasium for Peshtigo, Wisconsin, utilizing structural glulam. The advantage of glulam is its ability to span long distances without the need for multiple supporting members - allowing for expansive interior spaces. Furthermore, the material is relatively inexpensive, quick to assemble as a structure, and touted as fireproof and resistant to seasoning. In addition, the "factory growing" process allowed each project to be fully customizable. The form of the glulam members could be manipulated and supported in endless ways. The reaction to the Peshtigo buildings created a demand, and Hanisch created the company, Unit Structures, Inc., the first manufacturer of structural glue laminated timber. Soon, the company supplied materials to gyms, community centers, churches, and transportation buildings nationwide, including the arches for Chapel 2 at Scott Air Force Base.

PART II. ARCHITECTURAL INFORMATION

A. General Statement:

The documented building is located on Scott Air Force Base in St. Clair County, Illinois, and consists of the chapel (Chapel 2/Facility No. 5713), a Modernist interfaith chapel constructed in 1967, and an addition that was constructed in 1984.

Chapel 2, also known as the Cardinal Creek Chapel, replaced a former chapel that burned in a fire in 1964. The first chapel was a cantonment style chapel that served the Wherry Daly-Lewis community housing area. In 1966, the architecture firm Fields, Goldman & Magee (FGM) designed the existing Chapel 2.

The location of the chapel within a military base required that the design be nondenominational and welcoming to all faiths. The new chapel subsequently reflected contemporary design ideologies focused on the Modern Gothic within ecclesiastical architecture. The exterior of the chapel is modest and typical of the Modernist aesthetic, dominated by clean lines and orthogonal shapes.

The footprint of the chapel is roughly rectilinear. At the center of the plan, there is an interfaith sanctuary that is square in plan with chamfered corners. The sanctuary is separated from a double-loaded corridor and the remainder of the building by full-height partition walls. The corridor wraps the sanctuary and provides access to the sanctuary and the original support spaces along the perimeter of the building at the west, south, and east sides, including the main entrance vestibule and restrooms (west), offices and chaplain's quarters (south), and the sacristy, choir, and mechanical space (east), respectively. The support spaces are accentuated at the exterior and in plan through the articulation of each exterior corner, which features deeply recessed windows.

The exterior walls are clad in monochromatic common brown brick laid in a stretcher bond. The masonry is only broken by expansive corner windows, and a stretch of windows at the south side which were originally screened by wood fins. The walls are surmounted by a striking inflexed arch hipped roof which defines the exterior and interior sanctuary of the chapel.

In 1960, Theologian John Hayward spoke of chapel design, stating that in the sanctuary, all eyes should be directed toward the chancel where the room is the highest and the light is the brightest. This would inspire a common life and a common devotion that is not distracted by historical or cultural symbolism.

Following this dogma, the highest priority of design within Chapel 2 is the sanctuary. Located at the center of the building, the sanctuary is crowned with a striking inflexed arch roof. The slopes of the roof have an exponential rise that creates a central, steeple-like feature with a skylight that channels light into the sanctuary, directly above the chancel. This serves as the primary source of light in the sanctuary—symbolic of the light of inspiration from a higher power.

The interior architecture of the sanctuary is intended to draw the eye upward to the skylight, through the use of massive exposed inflexed arch laminated beams. The beams begin at the exterior corners and span the length of the building, sweeping through the interior of the sanctuary and upwards, terminating at the skylight.

In the remainder of the building, significant interior design elements were designed to be complementary and either accentuate the primary sanctuary feature of the imposing inflexed arches, or highlight specific interior areas. For example, there is only one interior instance of brick to clad the concrete columns which flank each entrance into the sanctuary. When the doors to the sanctuary are open, the use of brick visually frames and emphasizes the sweeping arches, which are centered on each entrance. Additionally, while the finishes throughout the interior are minimal, wood screens were placed in key areas, including behind the sedilia and at either end of the east corridor, only used by the clergy, to underscore the sanctity of these spaces.

Addition (1984)

The addition functions as a secondary space that includes classrooms, offices, a kitchen, and a multi-purpose space for fellowship. A "Future Addition" was historically planned and denoted as such on the architectural drawings for the chapel. The existing addition is similar in plan to the original proposed design. It is connected to the original building through a hyphen that extends from the center of the north facade of the chapel. The passage between the chapel and hyphen was created through the modification of an original window opening which was enlarged and reconfigured into the existing entrance opening.

The building footprint has an overall "L" shape and is one-story in height. Deviations to the main plan are located at the north end of the "L," which is accentuated by two vertical setbacks at the west and east side, creating a narrower portion at the far north end. The primary entrance is located south of the center on the west façade of the building. Flanking the entrance, the southern half of the west façade slightly projects from the main plane to accentuate and frame the entrance.

The building is a concrete block structure clad in a tan brick veneer laid to match the coursing of the chapel. Soldier coursing is utilized on the upper seven courses of the taller sections of the building and a panel of recessed sailor courses is located above the primary entrance. The building is capped with a flat roof that sits below the roof height of the chapel, indicating the secondary nature of the addition.

The primary interior room is a central classroom and activities space which originally featured movable partitions which encompass the west half of the building. At the southwest corner of this space is an individual classroom, separated from the central classroom space by full-height concrete block walls. The eastern half of the interior is dedicated to service and support spaces, including a kitchen, restrooms, and mechanical closet, and two offices (now classrooms).

B. Description of Exterior: Scott Air Force Base Chapel 2

1. Over-all dimensions:

Chapel Building: 98'- 4" x 84'- 2" and one story in height.

Addition: 82'- 4" x 80'- 0" and one story in height.

2. Foundations:

The foundations for the chapel and addition are concrete slabs. The chapel addition has a 5" concrete slab construction foundation with vapor barriers and the addition has a 4" concrete slab with vapor barriers.

3. Walls:

Chapel

The exterior walls of the chapel are predominantly clad with common brick veneer laid in a stretcher bond, with the exception of the exposed upper portion of the wall below the low level roof, which is clad in vertical wood siding.

Addition

The exterior walls are clad with similar common brick veneer; however, the upper seven courses of brick are laid as soldier courses.

4. Structural system, framing:

<u>Chapel</u>

The wall structure is frame construction composed of a $2" \times 4" - 2" \times 8"$ stud wall.

The main structural components of the roof framing are four inflexed glue laminated arches. The inflexed arches span from the exterior corners of the building to terminate at the apex of the roof at a steel compression ring. The full vertical load of the roof is supported by the arch system. The roof decking is supported by glue laminated purlins (four equally spaced across each roof slope) that extend from the perimeter of the roof and join to the arches near the base of the high level roof. Four horizontal beams at the base of the high level roof run perpendicular to the purlins to counter the horizontal tension created by the arches.

The roof covering the one story sections of the building is composed of a flat built-up roof supported by a 3" wood deck exposed on the interior.

Addition

The wall structure is masonry construction composed of 6" concrete block units with insulating inserts and truss type joint reinforcement.

The roof is a built-up ridged insulation flat roof supported by masonry bond beams incorporated into the wall structure and attached to the underside of a metal roof deck.

5. Openings:

a. Doorways and doors:

There are three entrances to the chapel: the primary entrance located at the west façade; a second entrance for clergy and the choir at the southeast corner; and a service and delivery entrance located at the west end of the north side. An exterior entrance located at the north end of the west façade provides access to a separate mechanical closet. The primary entrance originally contained double doors of solid wood each with twelve carved panels. These were replaced with non-historic full-light aluminum double doors in 2004. The primary entrance is accentuated by a

square, cantilevered canopy with flat, unadorned painted wooden fascia. The doors at the secondary entrances were also replaced with non-historic aluminum doors with full-light glass. The door of the mechanical room is a historic hollow metal flushed double door.

The entrances to the addition include: a primary entrance just south of the center of the west façade; an entrance at the north side which provided direct access to the classrooms; and an entrance at the east side. The doors are full-light aluminum doors that are not original to the construction of the addition, but were replaced in 2004. The original doors were full-light wood doors.

b. Windows:

All of the original windows in the chapel and addition were replaced in 2004, and the current, typical window type is a full height, tinted ¹/₄" Polished Plate Glass with wood surrounds clad with black aluminum flashing. The flashing is stepped toward the top to align with the depth of the recessed window with the wall coping above. This flashing was added in 2004 to cover the original plywood spandrel panel.

Chapel

At each corner of the building is a pair of fixed windows separated by wood columns clad in aluminum. Additional windows include: Two large, fixed typical windows at the west façade which flank the entrance doors; six fixed, floor-to-ceiling typical windows at the south side; and at the east side, a sidelight is associated with the clergy entrance door.

The skylight located at the apex of the inflexed arch roof is a 48" x 48" window composed of an extruded aluminum retaining frame, a ¼" acrylic sealed panel (white outside, clear embossed inside), and a ¼" clear acrylic grid (according to the plans).

Addition

The primary windows at the addition include corner windows at each side setback. Other windows include: a group of three fixed windows on the west façade of the hyphen; a transom window and sidelight at the primary west entrance; and two single fixed windows on the east end of the north side

6. Roof:

a. Shape, covering:

The principal design feature of the chapel is the sanctuary roof. It is an inflexed arch hipped roof composed of a low level roof and high level roof. The low level roof is designed as a standard low-pitched hipped roof with open eaves, exposing the ends of the glue laminated arches and purlins. The low level roof does not terminate in a typical hipped roof ridge, or peak, but ends at the base of the high level roof. The high level roof is defined by the sweeping glue-laminated arches that span from the exterior corners of the building to terminate at the skylight/ compression ring located at the peak of this roof. At the exterior, the structural design of the high level roof is

expressed as a truncated pyramid with gently sloping edges to resemble a traditional steeple.

The roofs over the remaining sections of the chapel (e.g., main corridor and secondary spaces at the perimeter of the building) are predominately composed of flat roofs with built-up roofing. The only exception is at the south section where the roof is slightly pitched to create a shallow "V" shape (1/2" per foot) that drains toward the center where an internal drain is located. On the interior, the "V" shape is expressed in the shape of the ceiling of the general offices and chaplain spaces as identified in the 1966 drawing set.

The roof of the addition is also a utilitarian flat roof, composed of built-up roofing.

b. Cornice, eaves:

At the exterior of the chapel, the complex roof structure is accentuated through an open eave which exposes the ends of the purlins and glue laminated arches. The exposed ends of the purlins are finished with a Unit Structures Inc. #623 coating of Mocha Pine colored stain, which is original to the building. The arch ends were cut off and replaced with solid wood in 1994 due to weathering/deterioration. The ends of the purlins and arches are capped with copper flashing.

There are no cornice or eaves on the flat roof over the addition.

7. Decorative features:

Overall, the building displays architectural elements typical of the Modernist style. The design is modest, with minimal ornamentation, utilizing the natural physical characteristics of the wood and masonry components to emphasize the unique roof and structural design of the building. Applied architectural ornamentation at the exterior of the chapel is limited to a series of full-height wood fins placed vertically at roughly one foot intervals along the width of the south side. The fins originally covered the full width of the side, but the fins in front of the windows have been removed.

The architectural detailing at the addition is limited to decorative brickwork, including seven stacked soldier courses on the upper portion of the sides, except at the north end of the building, and a recessed panel of seven stacked sailor courses above the main entrance on the west façade.

C. Description of Interior: Scott Air Force Base Chapel 2

Chapel 2 is located within Scott AFB. It consists of the chapel, which contained the sanctuary, rooms for the chaplains and choir, the sacristy and blessed sacraments, and offices, and an addition, which included classrooms, offices, a multiple-purpose activities space, and a kitchen.

Chapel

The interior of the chapel is centered on the sanctuary which is square in plan with chamfered corners. Entrances to the sanctuary are located at each corner. At the entrances, the ceiling of the corridor terminates, and openings reveal the arched roof structure above. The entrances

are flanked by two large, square, structural concrete columns clad with common brick. Each entrance is composed of a set of twelve light wood French double doors with a tall wooden panel above that holds a glass transom. Attached to the brick columns at each entrance is a waist-height holy water font and two tubular wall sconces at transom height. An aisle extends from each entrance to the central, raised chancel. Each aisle is flanked by wood pews which encircle the chancel – a character-defining feature of the "Chapel-in-the Round" form. Running east to west from the center of the chancel is the nave.

The present-day chancel is cleared of all furniture and decorative elements. Originally, the chancel contained a moveable altar, a choir with seating and an organ, and sedilia for clergy. These features are generally situated at the east to signify the rising of the sun and the resurrection of Jesus Christ. The choir was separated from the sedilia by a screen composed of square wooden fins secured with steel cable ties (non-extant).

The space is lit by natural light from transom windows above each entrance and the central skylight. Supplemental light is provided by florescent uplights affixed to each wall, and grand, cylindrical frosted glass and polished brass pendant light fixtures. The channel of light from the skylight is symbolic of the light of inspiration, and it aligns with the center of the chancel. The room is designed to draw the eye to the chancel and skylight through the use of the exposed, monumental, inflexed arches. These elements, as well as the purlins, beams, and exposed roof deck, were not painted or stained to highlight the natural characteristics of the material.

The sanctuary is separated from a double-loaded corridor and the remainder of the building by full-height partition walls. The corridor wraps the sanctuary and provides access to the sanctuary and the original support spaces along the perimeter of the building at the west, south, and east sides, including the main entrance vestibule and restrooms (west), offices, and chaplain's quarters (south), and the sacristy, choir, and mechanical space (east), respectively. The interior design of the support spaces is modest and features simple finishes, including vinyl tile, painted walls minimally ornamented with a wood baseboard and chair rail, and exposed plywood roof deck that has been painted. Additionally, two confessional booths are provided within the footprint of the chaplain's room in the southeast corner of the plan. Each booth retains its original sliding wood confessional panel, acoustical paneling, wood confessional kneelers, and unique Greek cross-shaped confessional light that when turned on, signaled to the chaplain that a penitent was waiting.

Addition

The interior of the addition is focused on a large classroom and multi-purpose activity space that encompasses the northwest of the addition. This space is immediately located off of the hyphen connecting the chapel with the addition and was historically subdivided into three rooms by movable partitions that have sense been removed. To the southwest of this space is the primary entrance vestibule to the addition and Classroom 104, and to the southeast is the kitchen and janitor's room. There are then two wings to the north and east which extend from the central classroom and activities space. The north wing is composed of a double-loaded corridor which leads to the secondary north entrance and is flanked by classrooms. The east wing is also composed of a double-loaded corridor flanked by the restrooms and mechanical spaces on the south and two offices on the north. The interior finishes of the addition are simple, featuring vinyl or ceramic tile, painted dry wall, and acoustical ceiling tiles.
D. Site:

1. General setting and orientation:

Located in southern Illinois, the terrain of Scott AFB is relatively flat, with elevations ranging from 440 to 460 feet above sea level. The area of the base is drained by Ash Creek, which runs along the western and southern boundaries, and Silver Creek, along the eastern edge of the base. Dense woodlands flank Silver Creek at the base's eastern boundary. To the north of the base are predominately agricultural lands and stands of timber that flank Cardinal Creek which runs through the northern third of the base.

The site of Scott AFB was chosen for its level terrain, excellent drainage, and location adjacent to the Southern Railway (SOU) line. A one-mile railroad spur was extended north from the SOU to connect with the base. Vehicular access to the base is provided by Illinois State Highways 158 and 161 and Interstate 64.

The flat, open landscape was ideal for the construction of runways and for aviation visibility. The layout of the field followed "a standard single-unit plan" that Captain Clinton Edgar and Engineer Albert Kahn devised at the beginning of World War I. The base was laid out on a grid plan with streets oriented north-south and east-west.

Within the base, the chapel is located in the northwest quadrant. It is sited on the north side of East Drive and between Pryor Drive (to the west) and Scott Lake Road (to the east). To the north of the chapel site are Cardinal Creek and two pools of water which make up the Scott AFB Pond. The building is oriented on a southwest to northeast axis, with the main entrances to both the chapel and the addition located on their respective western facade.

The terrain of the building site is characterized by a gently sloping hill, upon which the chapel is situated at its crest, creating a sense of prominence around the building. The hill slopes down along the south end of the site, which is located between the building and East Drive. This is the primary vantage point of the site from the road. The building is obscured from the north, east, and southwest by mature trees.

Along the west end of the site is the main vehicular drive, a large parking lot, and a former basketball court. The area to the west of the parking area was formerly occupied by the Wherry Daly-Lewis Housing area, demolished between 1998 and 2005, according to historic aerial photographs. This area is now occupied by a circular running track. To the north of the chapel, a rubber mulch pedestrian trail winds throughout the site and connects to the aforementioned running track.

A vehicular service drive is located to the east of the chapel. The drive, looped at the western end, moves eastward and connects with Scott Lake Road.

Additional features on the site include: three formed concrete storage units to the east of the chapel, an original bulletin board located adjacent to the primary entrance, and sidewalks that connect the parking lot and service drive to the building entrances.

The site is predominately landscaped with ornamental trees to mature evergreens planted at irregular intervals throughout the site. Historically, many ornamental trees were planted within the immediate vicinity of the chapel, but what remains in the present day are San Jose Junipers, a Spruce, White Pines, Crabapples, a large oak tree (relocated during the construction of the addition), and a fruit tree (also relocated).

PART III. SOURCES OF INFORMATION

A. Original Architectural Drawings:

<u>Chapel</u>

The as-built drawings were prepared in 1966 by the architecture firm of Fields, Goldman, and Magee of Mount Vernon, Illinois. Registered Illinois Architect Clifford R. Fields (license number 3855) approved the plans. The set provided by Scott Air Force base to the report preparers in 2024 was incomplete. A list of missing sheets is provided in Part I: Historical Information, Section A: Physical History, Subsection 5: Original Plans and Construction.

Addition

The as-built drawings for the addition were prepared in 1984 by the architecture firm of Kuhlman Design Group of Maryland Heights, Missouri. The architects worked in conjunction with the U.S. Army Corps of Engineers, who reviewed, recommended, and approved the drawings.

B. Early Views:
